

9. Reading and Writing Files:

- Write a function called `process_names_file(source_file, destination_file)` that reads from a source file containing a list of names (one name per line) and writes into a destination file the number of names and the names themselves sorted in alphabetical order. Implement error handling for file I/O operations and handle specific exceptions such as `FileNotFoundError`, `PermissionError`, `IOError`, and `UnicodeEncodeError`.
